Project Title:

Remote Work & Mental Health Insights Report

Team Members-

Abhishek Changde (2024H1540817P)

Shreya Gupta (2024H1540840P)

Venkata Sri Harini Gali (2024H1540842P)

Anakari Sravya Hadassa (2024H1540850P)

Kratika Garg (2024H1540855P)

Tarani Satya Kandula (2024H1540861P)

Under the guidance of-

Prof. Debasmita Dey

Insights & Recommendations

1. Work Satisfaction & Mental Health

- Low Satisfaction (36.16%) and Neutral Company Support (3.01/5) point to low engagement and trust.
 - **Action:** Improve recognition, clarify growth paths, and train managers in active support.
- Low Mental Health Awareness (49.91%) and Poor Sleep (33.84%) highlight wellness gaps.
 - **Action:** Launch recurring mental health campaigns, reduce after-hours work pressure, and promote screen-free time.

2. Stress & Work-Life Balance

- High Stress (32.68%) and Low Work-Life Balance (2.95/5) suggest widespread burnout.
 - **Action:** Offer flexible work hours, set “No Meeting” days, and promote regular breaks.
- Sleep and Balance by Gender: Women and non-binary employees report worse outcomes.
 - **Action:** Review workload fairness and offer gender-sensitive wellness support.

3. Remote Work & Productivity

- Only 31.4% Report Higher Productivity Remotely.
 - **Action:** Improve time management tools and reduce online distractions.
- Hybrid Workers Show Highest Drop in Productivity.
 - **Action:** Set fixed in-office days and streamline transitions.
- Remote Workers Put in More Hours Yet Stay Productive.
 - **Action:** Balance workloads and introduce recovery periods.

4. Industry-Specific Challenges

- Consulting & Finance: Low satisfaction and poor work-life balance.
 - **Action:** Use automation, limit overtime, and enforce disconnection periods.
- Manufacturing: Reports lowest work-life balance.
 - **Action:** Implement shift rotation and support non-operational roles with hybrid flexibility.
- Retail: Best balance due to clear job boundaries.

5. Job Role-Based Observations

- Project Managers & HR: Highest stress across industries.
 - **Action:** Improve delegation, structure, and introduce support tools.
- Designers & Marketing: Low balance despite low stress—may indicate burnout.
 - **Action:** Allow creative flexibility and schedule buffer time.
- Sales: Best work-life balance due to flexible, target-driven roles.

6. Remote Work Support

- Highest Support: Data Scientists, Software Engineers, HR.
- Lower Support: Sales and Designers—likely due to client or team interactions.
 - **Action:** Tailor hybrid models for client-facing roles and enhance tools for remote collaboration.

7. Regional Differences

- Oceania & Africa: High stress despite average hours worked.
- North America: Lower stress possibly due to stronger support and better compensation.
 - **Action:** Customize policies per region using employee feedback and adjust mental health and workload programs accordingly.

8. Social Isolation & Mental Health

- Burnout Correlates with High Isolation (3.04).
 - **Action:** Set up mentorship programs, virtual team check-ins, and build a culture of support.

Execution Plan

1. Remote Work Dissatisfaction by Industry and Region

- From the data, it's evident that remote work is not equally accepted across all industries. Healthcare and manufacturing employees report high dissatisfaction, and 66.6% of employees globally (4 out of 6 countries) show discontent with remote work
 - **Additional Insight:** Remote work support varies by role. For example, Sales and Designers report lower support due to client and team interactions.
 - **Extended Recommendation:** Tailor hybrid or onsite models for client-facing roles, and enhance collaboration tools for roles struggling with remote settings.

2. Low Productivity in Hybrid Work Models

- Our analysis shows minimal or no productivity increase with hybrid models.
 - **Additional Insight:** Hybrid workers show the greatest drop in productivity, likely due to inconsistent routines.
 - **Extended Recommendation:** Establish fixed in-office days for hybrid workers and streamline work transitions to maintain continuity and productivity.

3. Work-Life Balance and Sleep Quality in Young Employees

- Employees aged 21–30 report the lowest sleep quality and poorest work-life balance, increasing vulnerability to anxiety (1.12x more likely).
 - **Additional Insight:** Overall low satisfaction (36.16%), neutral company support (3.01/5), and poor sleep (33.84%) suggest broader gaps in mental wellness.
 - **Extended Recommendation:** Launch mental health awareness campaigns, promote screen-free time, and reduce after-hours work expectations, especially for younger staff.

4. Mental Health Conditions & Working Hours

- Burnout is linked with the highest number of hours worked, followed by anxiety and depression. Employees with poor mental health tend to take longer to complete tasks. Increased work hours raise anxiety risk by 1.9x.
 - **Additional Insight:** Burnout is also strongly tied to social isolation (score: 3.04).
 - **Extended Recommendation:** Beyond limiting overtime, implement virtual team check-ins, mentorship programs, and build a supportive culture to combat isolation.

5. Work-Life Balance and Sleep Quality Correlation

- A direct relationship is seen between higher work-life balance and better sleep, which positively affects mental health.
 - **Additional Insight:** Women and non-binary employees report worse outcomes in both sleep and work-life balance.
 - **Extended Recommendation:** Implement gender-sensitive wellness programs, regularly review workload fairness, and provide custom support resources for underrepresented groups.

6. Dissatisfaction with Remote Work in Young Employees (21–30)

- This age group shows significant discontent with remote work, likely due to lack of structure or social interaction.
 - **Additional Insight:** Younger employees may also experience higher stress and may benefit from in-person mentorship and guidance.
 - **Extended Recommendation:** Offer onsite work opportunities, and create structured career development and mentoring programs tailored to early-career professionals.

7. Improving the Average Work-Life Balance KPI (from 2.98 to 4.5)

- The current score of 2.98 reflects high burnout risk. A target of 4.5 would align better with productivity and wellness goals.
 - **Additional Insight:** Consulting, Finance, and Manufacturing industries reported particularly low balance.
 - **Extended Recommendation:** Enforce disconnection periods, rotate shifts, introduce "No Meeting" days, and leverage automation tools to reduce routine workload in high-stress roles.
